

HEA Outcome Analysis Report

COUNTRY :

Nigeria

Date of the analysis: 13th October – 16th March, 2019

Period covered by the analysis : September 2019 – August 2020

SUMMARY

The consumption year covered by the current analysis is **September 2019 – August 2020** for Ten livelihood zones, listed below:

- North West Millet & Sesame LZ (MAS)
- North West Cotton, Groundnuts & mixed Cereals LZ (CGC)
- North West Sorghum, Cowpeas and Groundnuts LZ (SCG)
- Northern floodplain Irrigated rice, Wheat and Vegetables LZ (NG11)
- Sahel mixed Cereals & Livestock LZ (NG13)
- North Central Maize, Sorghum and Cotton LZ (NG10)
- North East Millet, Cowpeas and Sesame LZ (NG12)
- North-East Sahelian: Millet, Sesame, Cowpeas and Livestock LZ (NG04)
- Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame LZ (NG05)
- North-East Maize dominant with Rice, Cowpeas, Soya beans and Groundnut LZ (NG15)

The period of consumption year covered by the current analysis is **September 2019 – August 2020** for the ten livelihood zones but across 6 states as projected. The analysis for all the states was analysed per Local government area (LGA)

The analysis shows that the very poor and poor households in Bungudu, Maru, & Tsafe LGA of Zamfara state) CGC livelihood zone would likely face a livelihood protection deficit (LPD) VP 33%, 34% & 34% and P 3%, 5% & 5% respectively.

Borno State, comprising NG10 and NG12 was analysed by LGA following the level of insecurity within the state and the result shows that in Abadam & Mobbar LGA (NG10), the very poor and poor HHs would likely face a LPD of VP 73% & 71% P 16% & 16% respectively. In Kala Balge & Marte LGA (NG12) the analysis shows that the very poor and poor HHs would likely face a LPD of VP 38% & 38%, P 26% & 26%.

In Yobe state the analysis shows the following:

In Yunusari LGA (NG04) the very poor would likely face a livelihood protection deficit LPD VP 33%.

In Fika & Tarmua LGA (NG05) the very poor would be likely to face a livelihood protection deficit LPD of VP 4% and 22% respectively.

In Gulani & Gujba LGA (NG15) the very poor would likely face a livelihood projection deficit LPD of VP 5% and 5% respectively.

Other LGAs and LZs are not expected to face any deficit within the consumption year except there is a major shock that would likely have an effect on household access to food and cash income

Households facing survival deficit would need urgent assistance to save lives during the deficit period, while households facing livelihood protection deficit would need assistance to protect their existing livelihood assets, to prevent depletion of asset and use negative coping strategies.

Other wealth groups across these LZs are not expected to face any deficit, this implies that these households not facing deficits would be able to access food and income needed to maintain basic survival and livelihood protection needs.

Official monitoring data on crop production and prices from Agricultural Development Programme (ADP) across the 6 states were used for the definition of the current year problem. Assumptions on changes in production and prices were made on the Problem Specification (PS) in consensus amongst the workshop participants, based on their field experience where official data does not represent the ideal situation.

I. LIVELIHOOD ZONES DESCRIPTION

The ten livelihood zones are primarily agricultural based and a variety of rain-fed crops suited to drylands areas including millet, sorghum, maize, rice, cowpeas, groundnuts, sesame, cotton as well as soybeans are grown. Rain-fed agriculture is carried out during the single rainy season which runs from April/May to October. The peak months of rainfall are June to August. In the dry season, food crops and market vegetables are grown on low lying river flood plains (or *fadama*) either through irrigation or flood retreated agriculture. The main period of harvest is from September to November. The dry-season harvest is March. In all the zones, livestock production supplements agriculture.

The North West **Sorghum, Cowpeas and Groundnuts LZ (SCG)** is primarily agricultural, supporting a wide variety of rainfed crops including millet, sorghum, maize, cowpeas, cotton and groundnuts, as well as rice and (increasingly) soybeans. Some market vegetables are also grown during the dry season on low-lying flood plains which are called *fadama*).

The **Sahel Mixed Cereals and Livestock LZ (NGI3)** in northern Nigeria occupying the West to East border stretch with Niger right into lake Chad, is moderately productive supporting production of cereal crops (millet, & sorghum), legumes (cowpea, groundnut, and sesame) and cash crops (pepper and Roselle) which are the primary livelihood source in this zone.

The longstanding cash crops of the North West **Cotton, Groundnuts, and Mixed Cereals LZ (CGC)** are groundnuts, cotton and soya beans. All are Rain-fed.

The **Northern Floodplains Irrigated Rice Wheat and Vegetable LZ (NGI1)** is Agro-pastoral with production of food (Millet, sorghum, maize, rice, wheat, groundnuts and vegetables) and cash crops (Sesame, pepper, and roselle) and keeping of livestock (cattle, goats and sheep) which are the main sources of food and cash income. The zone is found in the semi-arid to arid lowlands characterized by temperate climate. Fish and Gum Arabic are main natural resources, fishing which happens throughout the year in this zone is a source cash income.

The far northern zone of North West **Millet & Sesame LZ (MAS)**, in the Sahel savanna ecological belt, generally features good conditions for millet and sorghum, as in the Sudan savanna belt. In this relatively dry ecosystem, yields tend to be lower than further south. Cowpeas are important, and sesame is a successful cash crop, although many farmers cultivate groundnuts more. Unlike other livelihood zone, there is very little *fadama* land here, and vegetables are not common cash earners.

The Nigerian side of the Lake Chad within which the North East **Millet, Cowpeas and Sesame LZ (MCS)** is located is a semi-arid zone but particularly well suited to millet and cowpeas production, the cropping season involves irrigation and rain fed agriculture. Although livestock production is an important secondary activity in this zone, small ruminants are relatively more important here than cattle.

The North Central **Maize, sorghum and Cotton LZ (MSC)**, generally provides a good condition for maize, sorghum and cotton. Rice and cowpeas can be considered as cash crops in this zone, but dry season rice and vegetables are mainly grown for cash.

The North-East Sahalian; **Millet, Sesame, Cowpeas and Livestock LZ (NG04)**, Covering Nigeria's extreme northeast,

across Borno, Yobe and Jigawa states, this is the most arid of all the country's livelihood zones, with 350-500 mm rainfall per annum on average. Provided that the precipitation is well-spread across the agricultural season, the chief food crops, millet and cowpeas, and the most valuable cash crop, sesame, can be successfully grown on the mainly sandy soils of poor-to-medium fertility.

The **Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame LZ (NG05)**, this is among the largest livelihood zones in the country, composed of major parts of Borno, Yobe and Bauchi states but with also some LGAs of Jigawa and Gombe. As such its ecology is mainly sudanian, but it also has a more sahelian ecology in the northern limits and a more north guinean ecology in the southern limits. There is a concomitant geographical variation in average annual rainfall on either side of the general 700-900 mm per annum. But the main elements of the economy, with its crop and livestock mix, are reasonably consistent across the zone, although inevitably with localized variations. The dominant natural vegetation is savannah, and there is a mix of soil-types: sandy, loamy, vertisols and clay, making overall for moderate fertility. This zone is known as a traditional hub of millet production in the country.

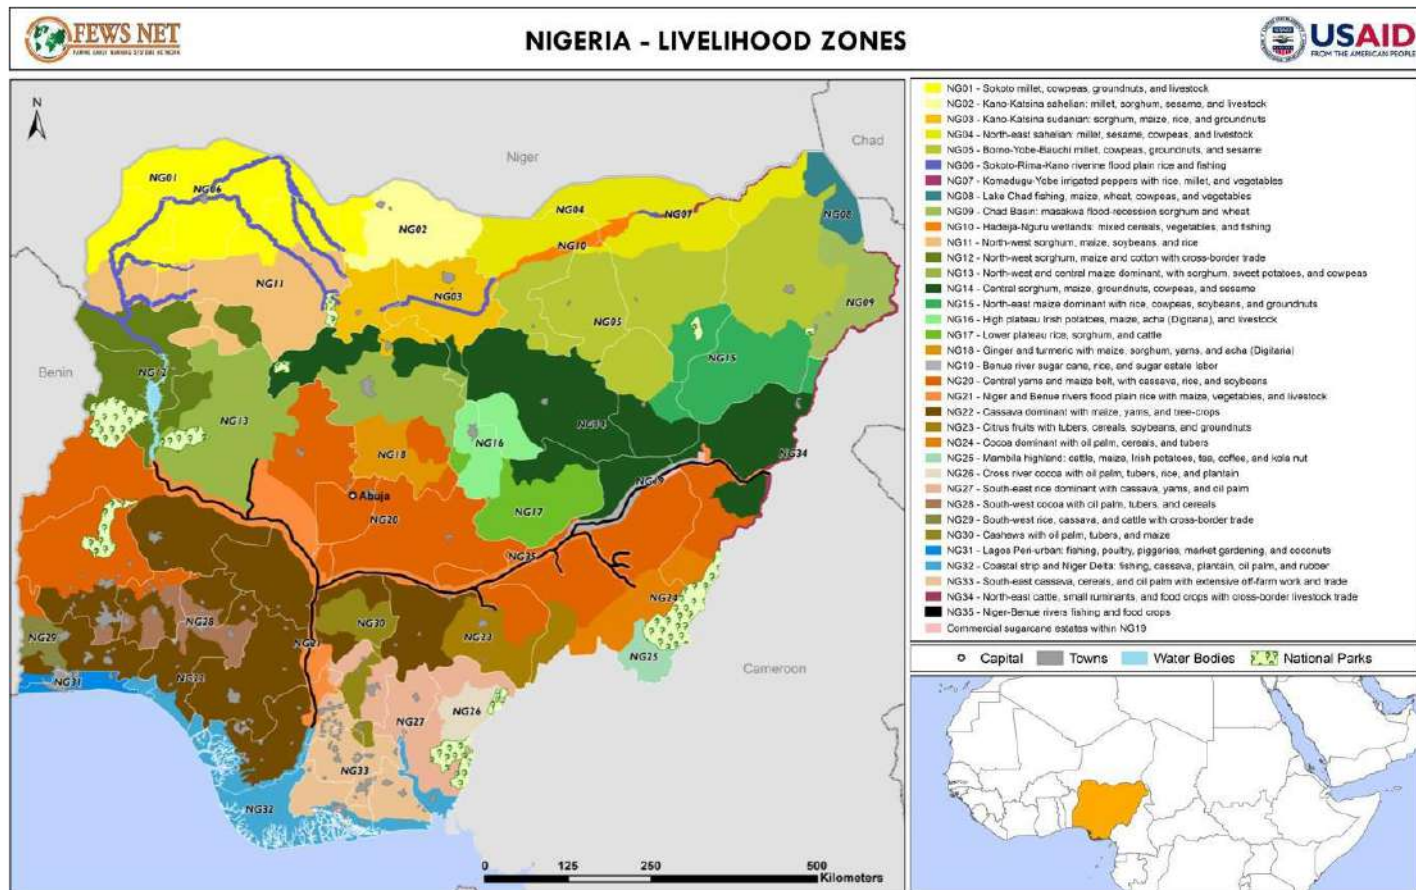

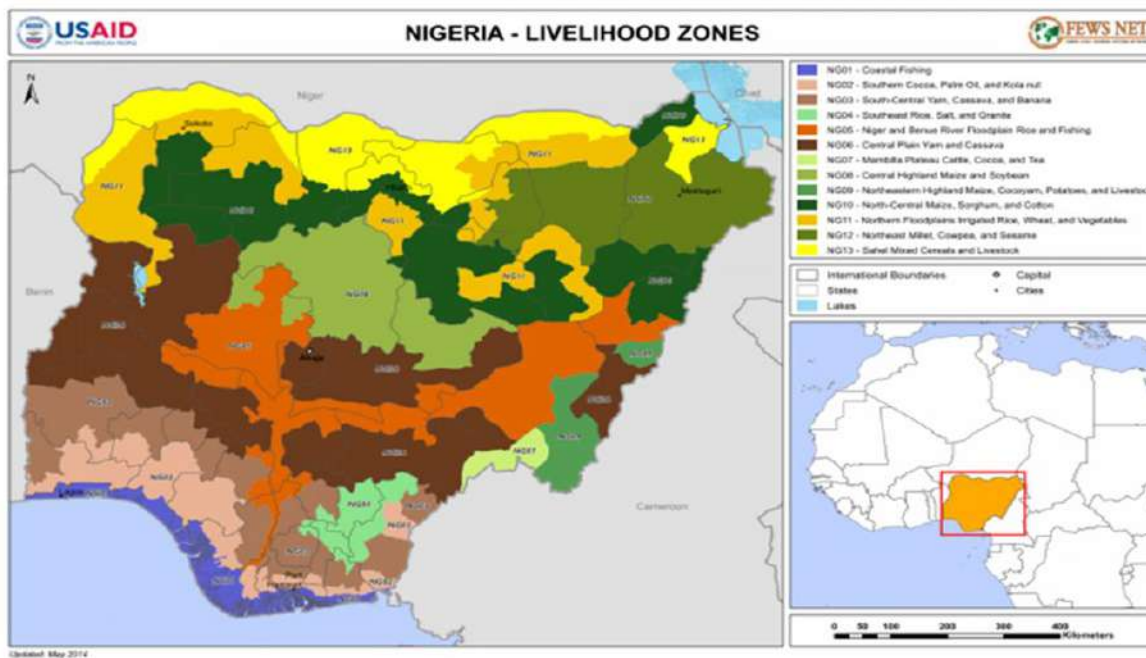

The **North-East Maize dominant with rice, Cowpeas, Soya beans and Groundnut LZ (NG15)**, Located largely in Borno state, with Biu at the center and with just a couple of LGAs in Yobe and Gombe. Considering its millet-based neighbor to the north, zone NG05, and its sorghum-based neighbor, zone NG14, to the south, one might expect this to be a transitional area between millet and sorghum. However, in less than two decades the zone has come to be dominated by maize production, and with sorghum as a distinctly secondary crop and millet very little cultivated. This is the result of a combination local ecology, farmers' opportunity cost judgements and official encouragement. Maize is a staple of the diet in a large part of the country, but it is also integral to many animal feed commodities, while its starch has industrial uses. In zone NG15, the north to south guinean ecology, the clay loam and sandy loam soils and average annual precipitation of 600-900mm combine to offer a favorable environment for maize production.

The reference year is not the same for all the livelihood baselines as outlined in the table below:

Livelihood Baseline	Reference Year
Millet & Sesame LZ (MAS)- Katsina	Sept 2009 – August 2010
Cotton, Groundnuts & mixed Cereals LZ (CGC)- Zamfara	Sept 2011 – August 2012
Sorghum, Cowpeas and Groundnuts LZ (SCG)- Zamfara	Sept 2012 – August 2013
Northern Floodplains Irrigated Rice Wheat and Vegetable LZ (NG11)- Jigawa	Sept 2016 – August 2017
Sahel Mixed Cereals and Livestock LZ (NG13)- Jigawa	Sept 2016 – August 2017
Millet, Cowpeas and Sesame LZ (NG12)-Bauchi	Sept 2012 – August 2013
Maize, Sorghum and Cotton LZ (NG10)- Bauchi	Sept 2012 – August 2013
Millet, Cowpeas and Sesame LZ (NG12)- Borno	Sept 2016 – August 2017
Maize, Sorghum and Cotton LZ (NG10)- Borno	Sept 2016 – August 2017
North-East Sahelian: Millet, Sesame, Cowpeas and Livestock LZ (NG04)	Sept 2017 – August 2018
Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame LZ (NG05)	Sept 2017 – August 2018
North-East Maize dominant with Rice, Cowpeas, Soya beans and Groundnut LZ (NG15)	Sept 2017 – August 2018

¹ Refer to seasonal calendars in baseline reports for further details on seasonality.

Previous Livelihoods Zone Map

New Livelihood Zone Map

II SCENARIO DEVELOPMENT/ PROBLEM SPECIFICATION

A problem specification is the translation of a shock or other changes into economic consequences at household level. It allows one to mathematically link the change (positive or negative) to each relevant livelihood strategy. The process of developing problem specifications is one of critically examining the effects of each type of change on each source of food, income and expenditure. There can be quite a large number of these sources, not all of which are equally important, and it is therefore useful to identify the key sources for each wealth group and each livelihood zone. A key source (key parameter) is defined as one that contributes significantly to total food or cash income¹, such that a reduction in access to that one source may have a significant effect on total access.

The scenario developed uses official government monitoring data on crop production and prices for the definition of the current year problem specification. Where official data was not available, assumptions were made based on a consensus amongst the workshop participants due to their field experience. As part of the scenario in the livelihood zones, it has been assumed that the 2019 rainy season will be normal and that agricultural labor opportunities for land preparation, planting and weeding will be stable for the remaining months of this year. The scenario developed is based on problem specification of key parameter data collected in the ten zones. All coping strategies are excluded from the scenario. Each element of the scenario analyzed can be monitored and revised as additional information becomes available. In addition, other scenarios can be analyzed if decision makers would like to understand vulnerability to different types of shock. For more details on the key parameters and their changes since the reference years, see the key parameter problem specification table at the bottom of the report.

III- PROJECTED FOOD SECURITY PROSPECTS

Crop	MAS	CGC	SCG	NG11	NG13	NG 10-BAU	NG 12-BAU	NG 10-BOR	NG 12-BOR	NG 04 YOB	NG 05 YOB	NG 15 YOB
Maize		100	100	116		112	110	113	114			95
Millet	112	100	100	111	116	116	130		90	100	100	103

Decrease Increase Not Important Not Available

¹ A key parameter is here defined as a source of food or income that contributes at least 10% of one wealth group's total food or income or at least 5% for each of two wealth groups' total food or income.

3.1- Period covered by the analysis

The period covered by the analysis is **September 2019 – August 2020** consumption year.

The Outcome Analysis started with a 4 days' field exercise on key parameter data collection across the ten livelihood zones after a review on the data collection tool without a refresher training in order to meet up with the October 2019 CH analysis schedule. Information was gotten from Agricultural Development Programme (crop production figures and market prices) from National Agricultural Extension & Rural Liaison Service (NAERLS). Other key parameter data were collected by members of the HEA working group (including government and non-government agencies) at the field.

3.2 Projected Outcomes by Livelihood Zone and by District with emphasis mainly on locations with Deficit

The results of the OA are presented in this section. These illustrates how scenario development and problem specifications are expected to impact total income for households in different wealth groups in the Ten livelihoods zones. The graphs presented below shows the result of the scenario development/problem specifications for very poor and poor households for a district within each livelihood zone.

I- NG08: North West Cotton, Groundnuts and Mixed Cereals Livelihood Zone

The results for the OA shows that Security related activities like Kidnapping and cattle rustling has continue to have an impact on HHs access to food and cash income. HEA suggested as projected LPD of 33% & 3% for the Very poor and poor HHs respectively. Other groups are not expected to face any deficit within this livelihood zone. This means that the very poor and the poor households would require support to meet their livelihoods needs to protect their existing livelihoods assets and prevent the use of high cost coping mechanisms.

There has been a little general increase in crop production, except for cotton which has remained on a 70% reduction when compared with the reference year. The reduction in cotton production is due to poor market/prices of cotton within the zone and country in general which has resulted to shift from cotton to other crops. The decrease in livestock remains due to cattle rustling as well as theft of small ruminants in this zone. Wage rates on casual and agricultural labor has increased, but the security conditions due to arm banditry and the rise in kidnaping within this zone has drop the availability of casual labor and a slight increase in food prices. The impact is more on the very poor and poor households, who depend largely on both casual and agricultural labor.

In the graph below Bungudu LGA was used but represents (Bungudu LGA) in the Cotton, Groundnuts and Mixed Cereals Livelihood zone.

2- NG04: North West Millet & Sesame Livelihood Zone

The results for the scenario analysis show that there will be neither survival nor livelihood protection deficits for any wealth group in this livelihood zone, this implies that households within this zone would be able to access both food and cash income need to survive and as well maintain local livelihood.

There is an increase in crop production also within the MAS LZ and this also resulted to increase in own crop consumed by both the very poor and the poor household income generated from both casual and agricultural labor has not significantly reduced when compared with the reference year therefore, there is every possibility that all the wealth group within this livelihood zone including the poor and the very poor would not be having either survival deficit or livelihood protection deficit.

However, Banditry, kidnaping and cattle rustling activities within the neighboring state Zamfara is being gradually moved to some part of the Livelihood zone (Katsina) if this continues it is expected that HHs in the affected area would not be able to cope or provide its HHs basic food and cash need.

In the graph below Baure LGA was used but represents other LGAs (Baure, Dutsi, Daura, Mashi, Zango and Sandamu) in the Millet and Sesame Livelihood zone.

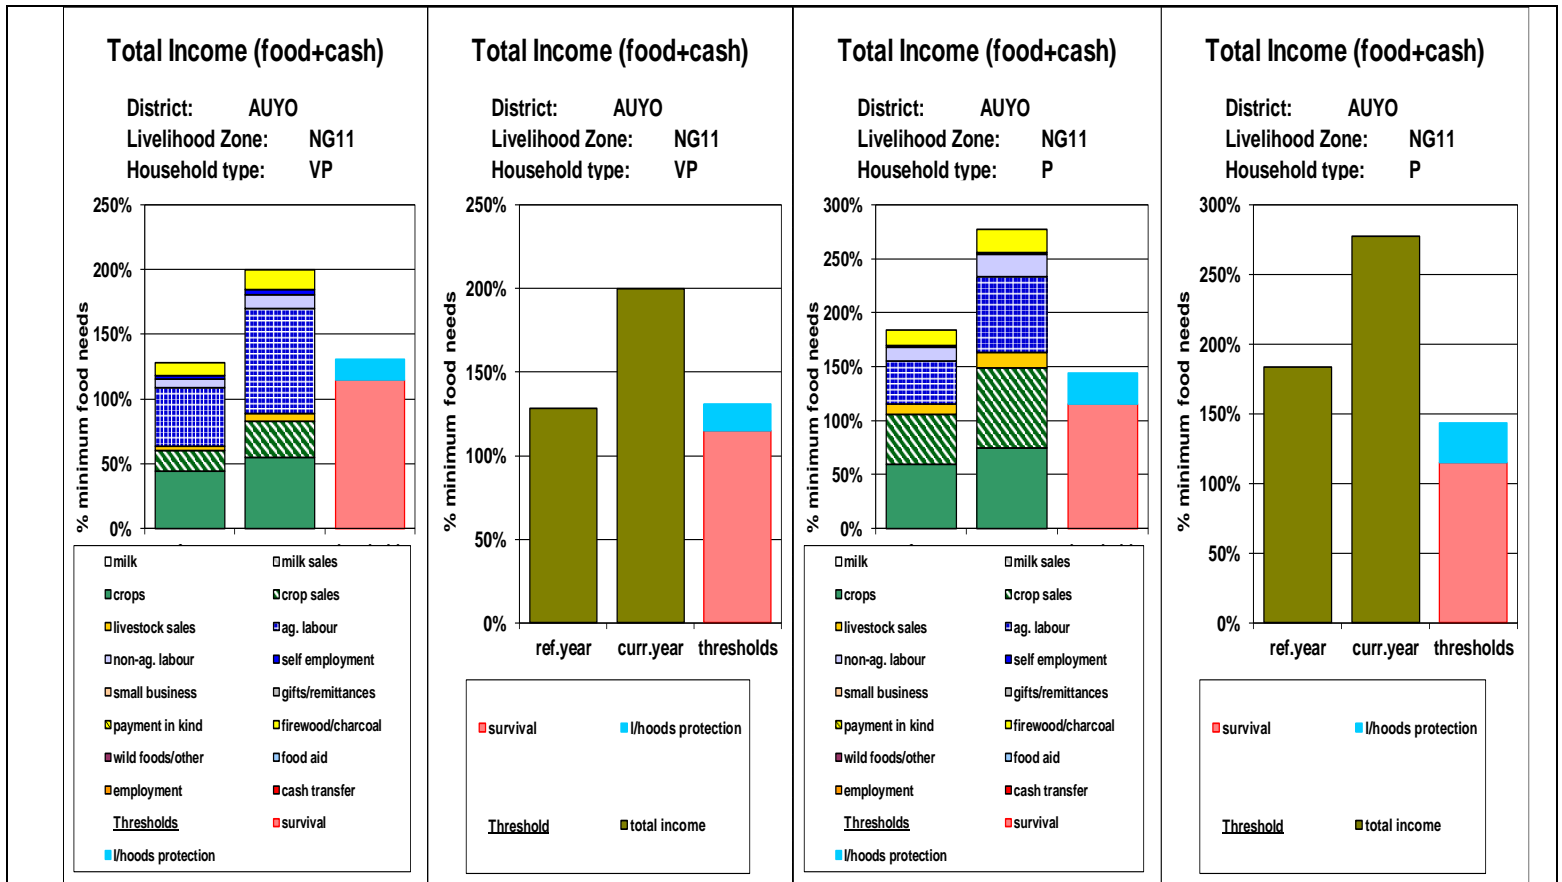

3- NGII: Northern Floodplains Irrigated Rice Wheat and Vegetable

The results for the scenario analysis show that there will be neither survival nor livelihood protection deficits for any wealth group in this livelihood zone, this implies that households within this zone would be able to access both food and cash income need to survive and as well maintain local livelihood. However, LGAs like Guri, Kirikasama and Auyo experience some level of flooding at the beginning of the raining season but farmers were able to plant improved crops that grow within 40days. Also this LGAs are into dry season farming which could complement that which they must have lost at the beginning of the planting season

There has been general increase in crop production within the LZ thereby increasing own crops consumed from 44% to 53 % for the very poor and 60% to 75% for the poor, crop sold and agric labour has also increased from 16% - 28%, 45% – 81% respectively for the very poor and 46% - 73%, 39% - 71% respectively for the poor. The analysis indicates that the very poor as well as other wealth groups can meet their basic staple food and livelihood needs. Hence no survival nor livelihood support would be required.

In the graph below Auyo LGA was used but represents other LGAs (Auyo, Guri, Hadejia, Kafin Hausa, Kaugama, Kiri Kassama, Miga and Malam Madori) in the Northern Floodplains Irrigated Rice Wheat and Vegetable Livelihood zone.

4- NGI3: Sahel Mixed Cereals and Livestock Livelihood Zone

The results for the outcome analysis (OA) shows that there will be no deficits for any wealth group within this livelihood zone. This implies that households within this zone would be able to access both food and cash income need to survive and as well maintain local livelihood.

There is an increase in crop production in the current year with respect to the reference year, and this has increased food availability from own crops as households especially the very poor and poor consume more portion of foods they grow than in the reference year (35% to 42% for the very poor and 41% to 48% for the poor). Household income increases also due to increase in agricultural labour (58% to 80% & for the very poor and 65% to 89% for the poor). household will be able to meet both their basic food and livelihood needs.

In the graph below Babura LGA was used but represents other LGAs (Babura, Birniwa, Dutse, Gagarawa, Garki, Gwiwa, Gumel, Jahun, Kazaura, Kiyawa, Maigatari, Malam Madori, Ringim, Roni, Sule Tankarkar, Taura and Yankwashi) in the Sahel Mixed Cereals and Livestock Livelihood zone.

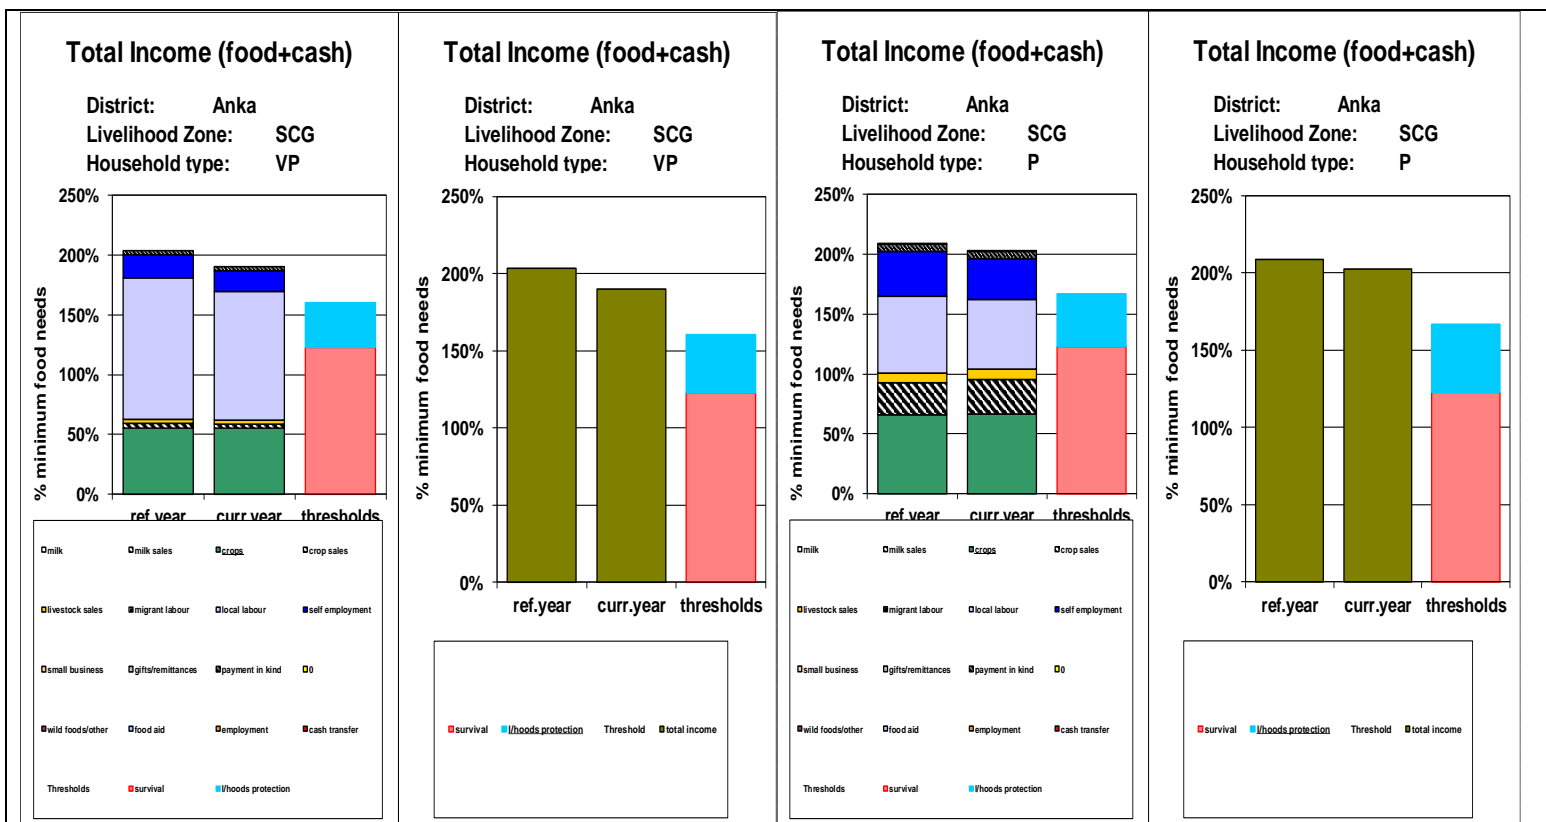

5-NG06: NW Sorghum, Cowpeas and Groundnuts Livelihood Zone

The results for the scenario analysis show that there will be no survival and livelihood protection deficits for any wealth group in this livelihood zone, this implies that no external support will be needed as households within this zone would be able to access both food and cash income needed to survive and as well maintain local livelihood.

Although income from labour and self-employment decreased significantly with respect to the reference year, also slight decrease in crop production (from 55% to 55% for the very poor and from 66% to 67% for the poor) Still households will be able to maintain both food requirement and access to basic livelihood protection without external assistant.

Security situation within the livelihood zone has continue to deteriorate this has pose a serious hardship for the residents, if the security situation has not improved it is expected that HH might begin to experience deficit.

In the graph below Anka LGA was used but represents other LGAs (Anka, Bukkuyum and Gumi) in the Sorghum, Cowpeas and Groundnuts Livelihood zone.

6-NG12: Bauchi State- NE Millet, Cowpeas and Sesame Livelihood Zone

The analysis indicates that no wealth group in this zone would face any deficit, either on survival or livelihood, this implies that households across the four wealth groups would be able to access food and cash required to meet their basic food and nonfood needs within the projected period.

There is a general increase in crop production within the zone, resulting to increase in own crop consumed (from 49% to 62% for the very poor and from 66% to 84% for the poor). Although there is a slight decrease on income from local labour (from 63% to 62% for the very poor and a no significant change (from 11% to 11%) for the poor, still the all households would be likely to maintain its energy requirement and access to basic means of livelihood.

In the graph below Misau LGA was used but represents other LGAs (Misau, Katagum, Gaide, Gamawa, Darazo and Damban) in the Millet, Cowpeas and Sesame Livelihood zone.

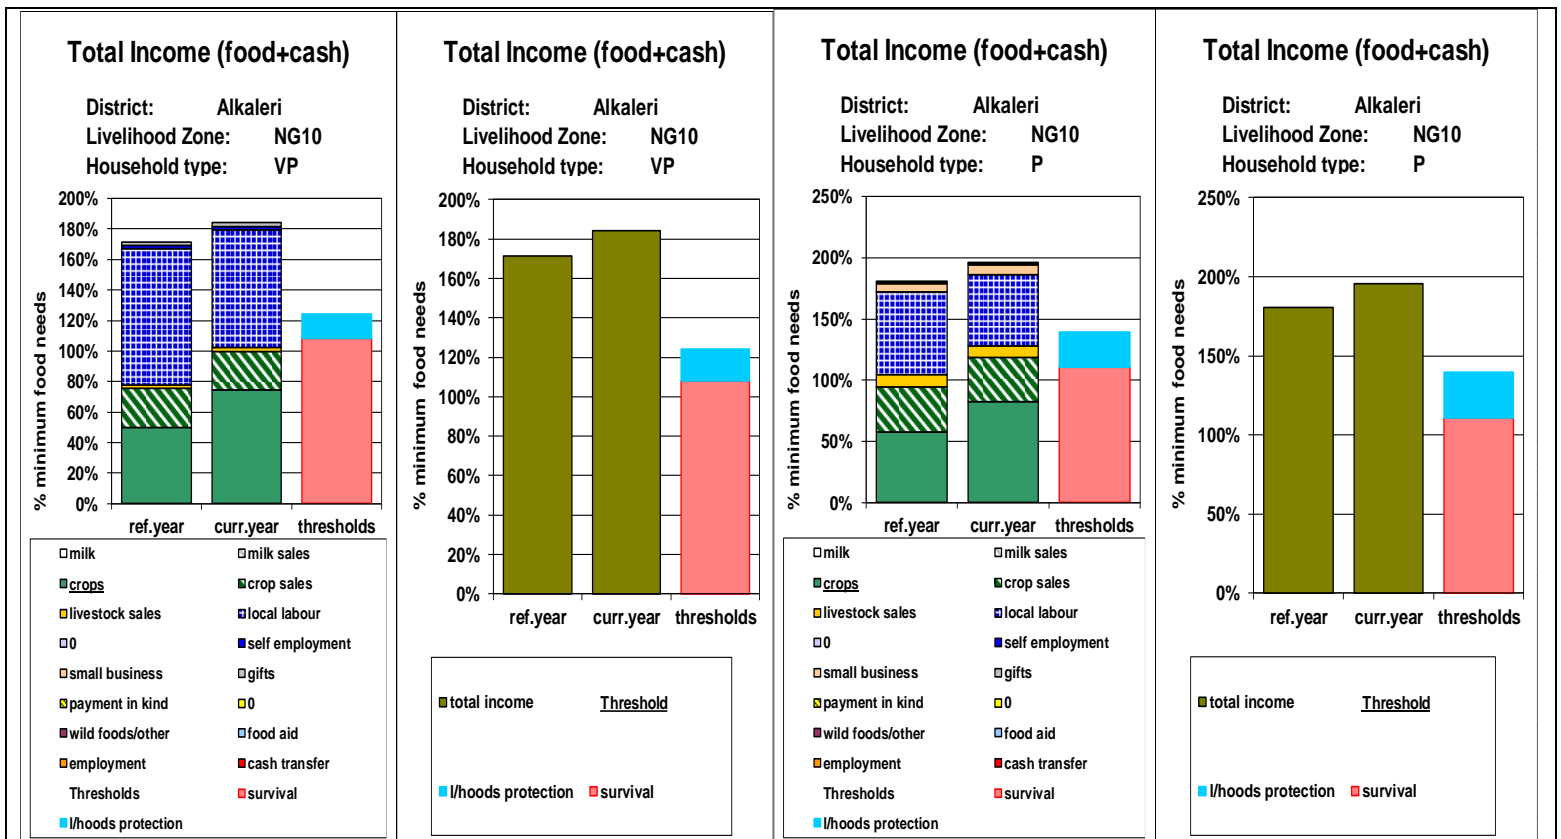

7-NG10: Bauchi State- NC Maize, Sorghum and Cotton Livelihood Zone

The Outcome Analysis for North Central Maize, Sorghum and Cotton Livelihood Zone shows no deficit in both survival and livelihood protection for all wealth groups, hence no external assistance would be required for this zone.

Crop production in MSC LZ increased generally as compared to the reference year. This has also increased own crops consumed across the wealth group (50% to 75% for the very poor and 58% to 83% for the poor), though income from casual labour reduced when compared to the reference year (from 89% to 77% for the very poor and from 67% to 59% for the poor) and no significant change in income from crop sales but it very possible that all household in all the wealth group not to have survival and livelihood protection deficit.

In the graph below Alkareli LGA was used but represents other LGAs (Alkaleri, Bogoro, Dass, Gamjuwa, Ningi, Toro and Tafawa Balewa) in the Maize, Sorghum and Cotton Livelihood zone.

8- NG12: Borno State- NE Millet, Cowpeas and Sesame Livelihood Zone

In Kala Bage & Marte LGA (NG12) the analysis shows that the very poor and poor HHs would likely face a LPD of VP 38% & 38%, P 26% & 26%. Other wealth groups are not expected to face deficits within the projected period. However, security situation has not significantly improved it is expected that HHs might face deficit if the security conditions continue to deteriorate.

Households facing survival deficit would not be able to meet their daily food needs and would therefore require urgent support to meet their food needs, while households facing livelihood protection deficit would require support to meet their livelihood needs. This implies that the very poor households would require support on both survival and livelihood as the analysis projects deficit on both in order to prevent the use high cost coping mechanism. Households not facing deficits would be able to access food and cash income to meet their normal food and nonfood needs within the projected period.

There is no significant change in crop production within the zone (Borno- NG12 LZ) as the insecurity persist and some communities still inaccessible, farming activities remain minimal resulting to fewer own crop consumption and income from crop sales. Income from Agric. Labour has slightly increased (from 27% to 36% for the very poor and from 21% to 29% for the poor) as well as income from self-employment (74% to 105% for the very poor and from 95% to 129% for the poor). The assumption here is the absence of food aid which is on average 12% across the livelihood zones.

In the graph below Bama LGA was used but represents other LGAs (Bama, Damboa, Dikwa, Gubio, Gwoza, Jere, Kaga, Kalabaje, Konduga, Mafa, Magumeri, Marte, Maiduguri, Monguno and Ngala LGA) in the Millet, Cowpeas and Sesame Livelihood zone.

9- NG10: Borno State- NC Maize, Sorghum and Cotton Livelihood Zone

The Outcome Analysis for North Central Maize, Sorghum and Cotton Livelihood Zone shows in Abadam & Mobbar LGA (NG10), the very poor and poor HHs would likely face a LPD of VP 73% & 71% P 16% & 16% respectively. Other locations within the zone are not expected to face deficit. Households facing survival deficit would not be able to meet their daily food needs and would therefore require urgent support to meet their food needs, while households facing livelihood protection deficit would require support to meet their livelihood needs. This implies that the very poor households would require support on both survival and livelihood as the analysis projects deficit on both in order to prevent the use high cost coping mechanism. Households not facing deficits would be able to access food and cash income to meet their normal food and nonfood needs within the projected period.

This livelihood zone is relatively stable in terms of security when compare with NG12 LZ within Borno, therefore crop production in Borno- NG10 LZ increased slightly as compared to the reference year and this resulted to increased own crops consumed across the wealth group (28% to 39% for the very poor and from 45% to 50% for the poor), Income from agric labour has increased significantly from 64% to 44% for the very poor and from 59% to 41% when compared to the reference year therefore it is possible that all household within the zone not to have any deficit.

In the graph below Biu LGA was used but represents other LGAs (Abadam, Askira Uba, Biu, Chibok, Hawul, Kwaya Kusar, Mobbar and Shani) in the Maize, Sorghum and Cotton Livelihood zone.

10- NG04: Yobe State- North-East Sahelian: Millet, Sesame, Cowpeas and Livestock LZ Livelihood Zone

The Outcome Analysis for North-East Sahelian: Millet, Sesame, Cowpeas and Livestock LZ (NG04 Livelihood Zone) shows that in Yunusari LG the very poor would likely face a livelihood protection deficit LPD VP 33% due to high insecurity activities going on within the LGA. Other LGAs within the zone is considered relatively peaceful, except for Bursari that has been having pocket of attack. Other locations within the zone are not expected to face deficit

Households facing survival deficit would not be able to meet their daily food needs and would therefore require urgent support to meet their food needs, while households facing livelihood protection deficit would require support to meet their livelihood needs. This implies that the very poor households would require support on both survival and livelihood as the analysis projects deficit on both in order to prevent the use high cost coping mechanism. Households not facing deficits would be able to access food and cash income to meet their normal food and nonfood needs within the projected period.

Farming activity is ongoing it is expected that HHHs within this LGA could provide for their immediate need as well as other livelihood protection. Any major attack on Bursari could force households to face deficit and could resort negative coping strategies. (Yobe SEMA & ADP) there is a slight increase in own crops consumed across the wealth group (27% to 28% for the very poor and no change 31% to 31% for the poor), Income from other sources has slightly decreased from 185% to 175% for the very poor and from 164% to 157%, the Poor however has more income from crop sales up to 41%. When compared to the reference year therefore it is possible that all household within other LGAs except Yunusari would likely not have any deficit.

In the graph below Bursari LGA was used but represents other LGAs (Jakusko, Yusufari, Nguru, Karasuwa & Machina) in the North-East Sahelian: Millet, Sesame, Cowpeas and Livestock Livelihood zone.

II - NG05: Yobe State-Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame LZ

The Outcome Analysis for Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame (NG05) Livelihood Zone shows that in. The Very poor HHs in Fika and Tarmua are currently facing a Livelihood protection deficit of 4% and 22%. it is obviously high in Tarmua due to recent attach on the community and local farmers. (Yobe State team) Other LGAs within the zone is considered relatively peaceful, farming activity is ongoing it is expected that HHs within this LGA could provide for their immediate need as well as other livelihood protection hence are not expected to face deficit.

Households facing survival deficit would not be able to meet their daily food needs and would therefore require urgent support to meet their food needs, while households facing livelihood protection deficit would require support to meet their livelihood needs. This implies that the very poor households would require support on both survival and livelihood as the analysis projects deficit on both in order to prevent the use high cost coping mechanism. Households not facing deficits would be able to access food and cash income to meet their normal food and nonfood needs within the projected period.

In the graph below FIKA LGA was used but represents ther LGAs (Potiskum, Fune, Nangere, Damaturu and Tarmuwa) in the Borno-Yobe-Bauchi; Millet, Cowpeas, Groundnut and Sesame Livelihood zone.

12- NG15: Yobe State-North-East Maize dominant with rice, Cowpeas, Soya beans and Groundnut LZ

The Outcome Analysis for North-East Maize dominant with rice, Cowpeas, Soya beans and Groundnut LZ shows that in Gulani & Gujba LGA (NG15) the very poor would likely face a livelihood projection deficit LPD of VP 5% and 5% respectively.

Gujba and Gulani is facing a lot of insecurity challenges this has reduced HHs access to farming and agric related labour INGOs are still providing intervention. It is expected that production in this LGA could drop due to security interference HEA projected that the Very Poor HHs could have a 5% deficit at the Lean season (June - August).

Households facing survival deficit would not be able to meet their daily food needs and would therefore require urgent support to meet their food needs, while households facing livelihood protection deficit would require support to meet their livelihood needs. This implies that the very poor households would require support on both survival and livelihood as the analysis projects deficit on both in order to prevent the use high cost coping mechanism. Households not facing deficits would be able to access food and cash income to meet their normal food and nonfood needs within the projected period.

In the graph below Gulani LGA was used but represents other LGAs (Gujba & Gulani) in North-East Maize dominant with rice, Cowpeas, Soya beans and Groundnut Livelihood zone.

IV- SUMMARY OF THE RESULTS COMPARED WITH THE TWO THRESHOLDS

The period of consumption year covered by the current analysis is **September 2019 – August 2020** for the ten livelihood zones but across 6 states as projected. The analysis for all the states was analysed per Local government area (LGA)

The analysis shows that the very poor and poor households in Bungudu, Maru, & Tsafe LGA of zamfara state) CGC livelihood zone would likely face a livelihood protection deficit (LPD) VP 33%, 34% & 34% and P 3%, 5% & 5% respectively.

Borno State, comprising NG10 and NG12 was analysed by LGA following the level of insecurity within the state and the result shows that in Abadam & Mobbar LGA (NG10), the very poor and poor HHs would likely face a LPD of VP 73% & 71% P 16% & 16% respectively. In Kala Balge & Marte LGA (NG12) the analysis shows that the very poor and poor HHs would likely face a LPD of VP 38% & 38%, P 26% & 26%.

In Yobe state the analysis shows the following:

In Yunusari LGA (NG04) the very poor would likely face a livelihood protection deficit LPD VP 33%.

In Fika & Tarmua LGA (NG05) the very poor would be likely to face a livelihood protection deficit LPD of VP 4% and 22% respectively.

In Gulani & Gujba LGA (NG15) the very poor would likely face a livelihood projection deficit LPD of VP 5% and 5% respectively.

Other LGAs and LZs are not expected to face any deficit within the consumption year except there is a major shock that would likely have an effect on household access to food and cash income.

Households facing survival deficit would not be able to meet their daily food needs and therefore requires urgent support to meet their food needs during the deficit period, while households facing livelihood protection deficit would require support to meet their livelihood needs, this will also prevent the use high cost coping mechanism. While households not facing deficits would be able to access food and cash income to meet their normal food and non-food needs within the projected period.

V- SEASONALITY

By combining information on total income with seasonal calendar data showing when different sources of food and cash become available, it is possible to generate projected pattern of consumption/ expenditure, by month, from **September 2019 – August 2020 as projected**. Based on the analysis above, the period when households are unlikely to be able to cover their livelihood protection needs (deficit) is shown in red on a seasonal expenditure graph presented below.

The seasonal expenditure graph depicts the month and timing for any form of intervention that the very poor and poor households might likely require; which is significant enough to have direct impact on their livelihood protection.

VI- RESPONSE OPTIONS AND RECOMMENDATIONS

- Focus on development interventions to improve resilience among the vulnerable households.
- Continuous monitoring of the security situation as well as staple food prices as the lean season progresses.
- Livestock protection program as well as improvement in the security situation especially within CGC livelihood zone to avert rustling.
- Government supports to Improve food access for the very poor and poor households as well as livelihood by providing basic farm inputs
- Government support in establishing food preservation programs especially vegetables.
- A joint assessment with partners is being encouraged.
- Government to intensify effort to improve the security situation in Nigeria.
- Government support to the Agriculture Development program (ADP) to ensure effective system support with respect to agriculture and as well data collection to inform decision making.

CONCLUSION

The period of consumption year covered by the current analysis is **September 2019 – August 2020** for the ten livelihood zones but across 6 states as projected. The analysis for all the states was analysed per Local government area (LGA)

The analysis shows that the very poor and poor households in Bungudu, Maru, & Tsafe LGA of Zamfara state) CGC livelihood zone would likely face a livelihood protection deficit (LPD) VP 33%, 34% & 34% and P 3%, 5% & 5% respectively.

Borno State, comprising NG10 and NG12 was analysed by LGA following the level of insecurity within the state and the result shows that in Abadam & Mobbar LGA (NG10), the very poor and poor HHs would likely face a LPD of VP 73% & 71% P 16% & 16% respectively. In Kala Balge & Marte LGA (NG12) the analysis shows that the very poor and poor HHs would likely face a LPD of VP 38% & 38%, P 26% & 26%.

In Yobe state the analysis shows the following:

In Yunusari LGA (NG04) the very poor would likely face a livelihood protection deficit LPD VP 33%.

In Fika & Tarmua LGA (NG05) the very poor would be likely to face a livelihood protection deficit LPD of VP 4% and 22% respectively.

In Gulani & Gujba LGA (NGI5) the very poor would likely face a livelihood projection deficit LPD of VP 5% and 5% respectively.

Other LGAs and LZs are not expected to face any deficit within the consumption year except there is a major shock that would likely have an effect on household access to food and cash income.

Although there are several humanitarian interventions in Borno (northeast) by partners, some HHs still face food insecurity within the LGAs, as some communities remain inaccessible following the persistence of security challenge with the region. Very poor households in CGC LZ as well as some LGAs in Borno and Yobe state would require support to meet their non-food needs.

Persistent armed bandits attack in CGC & SCG LZ (Zamfara state), resulting to kidnapping/killing in some communities has significantly affected activities within the zone and the entire state of Zamfara, this activity is gradually affecting neighbouring state katsina and if this continues the very poor and poor HHS might be affected and would not be able to provide its basic food and non-food requirement.

Households facing survival deficit would not be able to meet their daily food needs and therefore requires urgent support to meet their food needs during the deficit period, while households facing livelihood protection deficit would require support to meet their livelihood needs, this will also prevent the use high cost coping mechanism. While households not facing deficits would be able to access food and cash income to meet their normal food and non-food needs within the projected period.

In the longer term, development efforts should continue to focus on assisting the very poor and the poor to secure more stable sources of income to complement crop and livestock farming.

VII- ANNEX

7.1- Table summarizing key parameters figures (problem specification)

NG08: NW Cotton, Groundnuts and Mixed Cereals Livelihood Zone

Problem Specification for NW Cotton, Groundnuts and Mixed Cereals Livelihood Zone		
Key parameter	Production Problem	Price Problem
Cattle	65%	138%

Marte is considered a highly insecure area this location remained inaccessible. The Borno team however revised the situation with Borno SEMA to suggest if there are people within this location, they would be facing a livelihood protection deficit

These LGAs within the zone is considered relatively peaceful, except for Bursari that has been having pocket of attack. Farming activity is ongoing it is expected that HHS within this LGA could provide for their immediate need as well as other livelihood protection. Any major attack on Bursari could force households to face deficit and could resort negative coping strategies. (Yobe SEMA & ADP).

Fika	136736	NG05	VP	23 245	17%	4%	0%	0%	0%	Gujba and Gulani is facing a lot of insecurity challenges this has reduced HHs access to farming and agric related labour INGOs are still providing intervention. It is expected that production in this LGA could drop due to security interference HEA projected that the Very Poor HHs could have a 5% deficit at the Lean season (June - August). the Very poor HHs in Fika and Tarmua are currently facing a Livelihood protection deficit of 4% and 22%. it is obviously high in Tarmua due to recent attach on the community and local farmers. (Yobe State team)
